

Typical Installation Guide for Security Labels

Our tamper evident labels are designed for affixing to a variety of surfaces. We have many configurable options for size and adhesive construction (based on service range needs and type of surface) to assist you in matching the appropriate product for the application.

Please note, there are characteristics to surfaces such as material composition, texture and coatings which influence the adhesive performance. We offer free samples and it is important that the labels be tested on the intended application. Equally important to the proper product selection is proper surface preparation and installation in determining overall label functionality.

Installation Instructions

1. Application surface must be clean and dry. If possible, use a mixture of 90% Isopropyl Alcohol (IPA) and wipe surface dry with a clean paper towel (do not let alcohol air dry).
2. When applying the label to a difficult surface, over a seam, gap or the bend of a container, box, etc. it is important to have the optimal orientation to prevent the labels from flagging (see below - perpendicular to the seam).
3. We recommend selecting a label that will make sufficient contact with both sides of the seam or bend to prevent adhesive failure. Another option for difficult applications is to include perforations at the fold over point to improve adhesion.
